Define a new process for vacation tracking #422

[Edit](#)[New issue](#) Closed

adamralph opened this issue 28 days ago · 17 comments

adamralph commented 28 days ago · edited

Task force: @karenfruchtman @adamralph

Problem definition

This is an outcome of #408. Note that this issue is scoped such that the FTO policy remains a fixed constant and deals purely with revising the process for vacation tracking to match the requirements of the policy. It is only one of the action points that resulted from #408.

Our current solution for ensuring that people are taking enough time off is unnecessarily complex and has potentially undesirable side effects, and is mixed together with our process for tracking sick days for Israeli employees. The best explanation of this problem is in the meeting which took place to close out #408.

Skills and knowledge needed

People online.

Description of issue

The purpose of this issue is to simplify our solution for ensuring people are taking enough consecutive days of time off to the bare minimum required, avoiding side effects decoupled from tracking sick days for Israeli employees.

Description of expected outcome

A solution for ensuring people are taking enough consecutive days of time off to the bare minimum required, avoiding side effects, decoupled from tracking sick days for Israeli employees.

Plan of Attack

- ☒ Retire the current vacation and sickness spreadsheet
- ☒ Create a new spreadsheet to record tracking of minimum vacation for all staff
- ☒ Set up a quarterly email to remind people to update the vacation spreadsheet
- ☒ Reduce the monthly email to Israel employees only and sick day tracking only and ask for a reply, rather than an entry into the sheet
- ☒ Split https://github.com/Particular/StaffSuccess/blob/master/Procedures/Vacation_and_sick_tracking.md into two documents, one for minimum vacation tracking and one for Israel employee sick day tracking - #424 #425
- ☒ RFC vacation changes via Slack @adamralph - <https://particularsoftware.slack.com/archives/announcements/p1475075993000121>
- ☒ RFC Israel employee changes via email @karenfruchtman
- ☒ Announce - <https://particularsoftware.slack.com/archives/announcements/p1475665984000134>

@karenfruchtman this LGTM.

I made a couple of small tweaks. Please review the latest version.

I'm happy for this to be merged as is.

Decisions without managers

Written by Karen Fruchtmann on August 24, 2017 • 4 Comments

Decision making is tricky business. Decisions often move up and down the chain of command without the input of those best equipped to make those decisions. In smaller companies, there's often too much reliance on the CEO, and that doesn't scale as the company grows. Ultimately, we can easily end up in a situation where the input of those most knowledgeable is not considered.

At Particular Software, we've struggled with these types of issues as our company has grown, and that's led us to rethink our organizational structure. We've eliminated our old departments and switched to working in small groups, bringing together those with the right skills, knowledge and context to get the work done. We've even gone a step further and eliminated our management positions.

Overnight, the former directors were stripped of their titles, but not one of them stormed out in protest. Instead, they chose to trust that their depth and breadth of knowledge would continue to guide staff and positively impact the

Introduction to NServiceBus

The best way to get started with NServiceBus is to use it to build something realistic. In doing so you'll learn the architectural concepts behind the software, and start to learn its capabilities. In this tutorial, you'll be building a back end for a retail e-commerce system. You'll learn how to send asynchronous messages between processes, how to use the Publish/Subscribe pattern to decouple business processes, and the advantages of using reliable messaging to enable automatic retries after processing failures.

The tutorial is divided into five lessons, each of which can be accomplished in a half hour or less — perfect for your lunch break.

- **Lesson 1: Getting started** (10-15 minutes) - learn how to set up your development environment and create your very first messaging endpoint.
- **Lesson 2: Sending a command** (15-20 minutes) - learn how to define messages and message handlers, and send your first message.
- **Lesson 3: Multiple endpoints** (15-20 minutes) - learn how to create multiple endpoints and send messages between them.
- **Lesson 4: Publishing events** (25-30 minutes) - learn about the Publish/Subscribe pattern, how to publish events to multiple subscribers, and about the benefits of using this pattern to decouple business processes.
- **Lesson 5: Retrying errors** (25-30 minutes) - learn how to use the Particular Service Platform tools to gracefully recover from exceptions in your code, allowing you to build systems that are resistant to failure.

When you've completed all the exercises, your solution will look like this:
